Project Title: Swim Team Scheduling and Performance Platform for University of Evansville Swimming & Diving

Primary Users/Stakeholders: The primary client would be the University of Evansville Swimming & Diving coaching staff, particularly the head coach. Swimmers would also be major users and stakeholders of the system. I already have direct access to the coaching staff and swimmers, which will make communication, requirements gathering, feedback, and testing much easier. I have discussed the project and draft proposal with my coach, and he responded positively to the direction and current feature set.

Data Collected or Used: The project will mainly use athletes' class schedules, team schedules, swimming performance results, goals, and practice information. For the current proof of concept that is approaching I will be using fake data to simulate the end goal.

Privacy/Security Concern: Student-athlete class schedules, team information, and performance information could potentially contain private information that my client would prefer staying private. My project will need to ensure that users only have access to data that is appropriate for their role and ensure that only the right people have access to the system.

Accessibility/Usability Concern: The project should be easy to use for both coaches, swimmers, and other potential users. The system should be easily understandable for users, for important information such as scheduling conflicts it should not just rely on only colors for example and should also clearly be shown using text as well as other indicators.

Possible Misuse or Failure Case: If an athlete's schedule is entered incorrectly or is outdated, it could potentially cause the system to recommend incorrect practice times that actually do conflict with schedules. Performance data could also be misused by comparing athletes in an unfair manner without proper context which could be hurtful towards certain athletes.

Ethical Issue or Professional Responsibility: With my project I now have a responsibility to protect the information of University of Evansville student athletes and coaches. I also must be honest about system limitations and ensure that scheduling and performance data is not presented in a way that could unfairly affect athletes.

Safeguard or Design Improvement: I will use role-based permissions in my project to separate coaches and swimmers giving the appropriate levels of access for each. I also plan to include in my project that scheduling recommendations should show the conflicts used to create the recommendation so that coaches can review the result before making a final decision. I want the system to help my coach and team rather than make things harder by giving unclear or misleading feedback.

What I Will Include in My Proof of Concept: My proof of concept will include five fictional swimmers with mock class schedules. This mock data will be used to demonstrate my frontend, backend, and the basic conflict-detection logic that the project currently contains.

One Limitation I Need to Document Honestly: A big limitation of my project is that it depends on correctly entered schedule data and does not yet account for travel/transition time between classes/practices. It also uses mock data as of now rather than real athlete schedules as I want to make sure everything works before using sensitive information.
